

Polyurethane differential mountings for TR4A - TR6

The differential mounting arrangement is a well-known weak point on the IRS TRs. The weaknesses inherent in the original chassis mountings are only compounded by the effects of tired rubber differential mounts – shock loads on acceleration, over-run and hard cornering do nothing to help matters.

Unlike the original specification rubber differential mounts, Revington TR polyurethane differential mounts will not degrade with time, temperature or oil contamination, and provide a tight, stable, low-vibration mounting of the differential to the chassis.

For the competition minded the benefits of using this component will be found in much less differential movement resulting in better drive shaft stability and improved chassis life. The two rear mountings are shown in the photograph with the appropriate differential forward mounts.

PRODUCT PRICE GUIDE

TR5-6 **SPF1992K**
Differential rear mounting set

The kit consists of 2 mountings and should be used in conjunction with forward polyurethane mountings.

TR5-6 **SPF0138K**
Differential front mount set

TR4AIRS cars do not use new mounting Part Number SPF1992K. Owners of these cars should order the following.

TR4A IRS **SPF0138AK**
Differential complete mounting set

You can browse and order from the complete range of TR parts together with the Revington TR range of performance enhancing components at
